For stable, high reliability performance...

The paper making process requires bearings having specific capabilities for each part of the process. **NTN** ensures reliable paper production by providing bearings that are optimally suited for each process.

Pulp Manufacturing Process

Paper Machine Wire Section

Paper Machine Press Section

Paper formation begins by dewatering the paper stock feed

Additional water is removed from the wet paper sheet by the press rolls

ULTAGE

ULTAGE Series

Spherical Roller Bearings [Type EA, Type EM]

Long operating life, higher load capacities and enhanced high-speed operation provide maximum equipment productivity

Construction

Type EA

- Window-type pressed steel cage

Outer ring

- With oil inlets and oil groove
- Optimal curvature

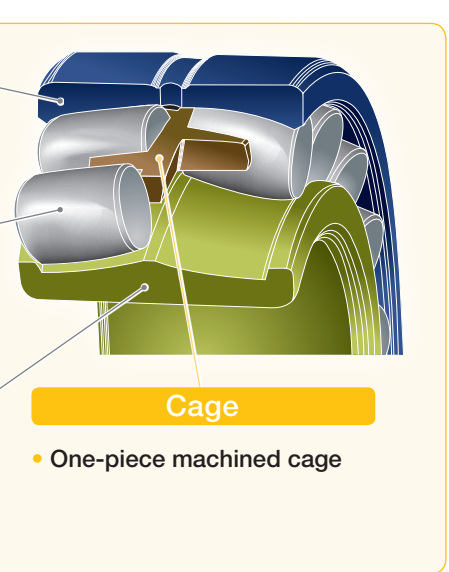

Rollers

- Symmetrical design
- Larger rollers
- Maximum number of rollers

Inner ring

- No rib required
- Optimal curvature

Type EM

Cage

- One-piece machined cage

Features

● High-load capacity

By using larger diameter, increased number of rollers...

Basic dynamic load rating
Up to **65% higher**
(compared to NTN conventional products)

Basic static load rating
Up to **35% higher**
(compared to NTN conventional products)

● High-speed performance

By using optimized curvatures and a new retainer design...

Maximum shaft speed
Up to **20% higher**
(compared to NTN conventional products)

● Long operating life

By increasing the load capacity...

Operating life
Up to **5 times longer**
(compared to NTN conventional products)

● Heat-resistant performance

By using advanced material heat treatment technology...

Dimensional stability
Up to **200°C**

Refer to the technical data (p-7)

Refer to the size charts (p-21)

"ULTAGE" (a name created from the combination of "Ultimate," signifying refinement, and "stage," signifying NTN's intention that this series of products be employed in diverse applications) is the general name for NTN's new generation of bearings that are noted for their industry-leading performance.

ULTAGE

ULTAGE Series

Sealed Spherical Roller Bearings [Type WA]

Features

High performance sealing

Long operating life with high contamination resistance is achieved by using the **NTN EA** internal specifications with a specially designed contact-type rubber seal.

Interchangeability

Can be installed into standard type plummer blocks by adjusting fixing ring size.

Bearing Specifications

Lubricant grease

- Lubricate with lithium based oil grease containing extreme pressure additives
- Grease pack amount : 15 to 25% of space capacity

Premitted rotational speed

- When re-lubricating : $dn \leq 60 \times 10^3$
- When not re-lubricating : $dn \leq 80 \times 10^3$

$[dn = d \text{ (bearing bore diameter [mm])} \times n \text{ (shaft speed [min}^{-1}\text{)}]$

Premissible alignment angle

- 0.009 rad (0.5°)

Premissible operating temperature range

- Bearing temperature : -20 to 110°C

[Bearing rotation torque test conditions]

Bearing : WA22218EALLSD1
 Load : Radial load 294N
 Shaft speed : 200 - 1400 min⁻¹
 Lubrication : Lithium based grease containing extreme pressure additives

Grease pack amount : 20% of space capacity

These bearings are shipped packed with grease

[Rotation torque test results]

Refer to the size charts (p-29)

Plummer Blocks

Features

Manufactured and designed at NTN's exclusive casting plant in Japan to provide seamless integration

- ▶ Suitable for withstanding impact, vibrations, and heavy loads.
- ▶ Suitable for a broad operating temperature range (-20 to 300°C*).
- * This is the temperature range for the plummer block body. Special heat treatment is required for bearings.
- ▶ Selectable lubrication method (grease or oil).

Plummer block seal types

Rubber seal

Rubber seals are mainly used for grease lubrication with a maximum shaft speed of 5-6 m/s /.

Felt seals

Felt seals and rubber seals are interchangeable. These can only be used with grease lubrication. Felt seals are not suitable for use in high dust, humidity environments. The maximum shaft speed for felt seals is approximately 4 m/s.

S-shaped seals

S-shaped seals (synthetic rubber seals w/spring) have excellent sealing performance and are usable for grease and oil-based lubricants (plummer blocks have a special specification). The maximum shaft speed for S-shaped seals is 10-12 m/s. Caution is required regarding the surface finish and hardness of the shaft especially in the seal contact area.

Labyrinth seals

Labyrinth rings are easy to install by O-ring attachment and are loosely fitted to flexibly follow the extension and contraction of the shaft (h9 shaft tolerance).

ULTAGE

ULTAGE Serise Spherical Roller Bearings

Long operating life, higher load capacities and enhanced high-speed operation provide maximum equipment productivity

▶ Type EA, Type EM

World's Highest Standard Load Capacity

By maximizing the roller diameter, the number of rollers and roller design, longer operating life and higher load ratings have been achieved. With this improvement maintenance cycles can be extended.

- ① **Basic Dynamic Load Rating : Up to 65% higher**
(compared to **NTN** conventional products)
- ② **Basic Static Load Rating : Up to 35% higher**
(compared to **NTN** conventional products)
- ③ **Operating Life : Up to 5 times longer**
(compared to **NTN** conventional products)

● Comparison of other manufacturer's cataloged basic dynamic load rating values (C_r)
22216 (ø80 × ø140 × 33)

● Comparison of other manufacturer's cataloged basic static load rating values (C_{or})
22216 (ø80 × ø140 × 33)

World's Highest Standard Maximum Shaft Speed

Higher operating speeds have been achieved by using an optimized design pressed steel cage.

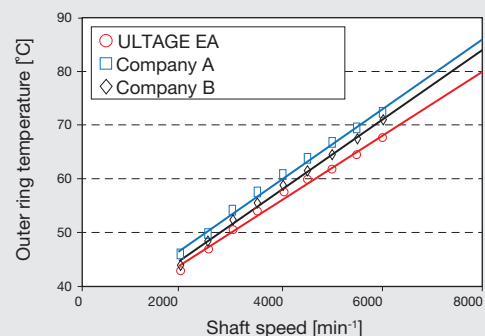

Limiting speed : Up to a 20% increase when compared to NTN conventional products

The results of comparative bearing temperature rise testing under circulating oil conditions shows that this bearing reduces temperature rise at a lower torque compared to other manufacturer's bearings.

● Comparison of other manufacturer's cataloged shaft speeds
22216 (ø80 × ø140 × 33)

● Temperature rise test results (circulating oiling)
22216 (ø80 × ø140 × 33)

Enhanced Loads : Smaller Bearing

Due to higher load capacity a smaller, lighter weight bearing is used to achieve a longer life.

Part Number	Basic Load Rating		Basic Dimensions mm	Weight kg	Life Ratio
	Basic Dynamic Load Rating	Basic Static Load Rating			
22220B	315	415	ø100 × ø180 × 46	4.95	1
22217EA	324	330	ø85 × ø150 × 36	2.59	1.1
			△ 20%	△ 48%	10%

Overall size reduction up to **20%**

Weight ratio reduced by **48%**

Calculated operating life increased by **10%**

Outer Ring Oil Groove/Holes Standard

ULTAGE bearings are equipped with oil groove/holes as a standard feature. D1 is Japan specification, W33 is Europe specification. (22205, 22206, and 22207 support W33 specification)

Bearing Outside Diameter mm		Number of Oil Holes	
Including	Less Than	D1	W33
		Z _o	Z _o
—	320	4	3
320	420 ¹⁾	8	3

1) 420 mm is included in this size class.

Bearing outer ring shape

W_o and d_o differ according to the model number. Refer to the catalog bearing size charts.

! Do not use the oil holes as position locating holes.

Improved Easy Handling

Assembly, disassembly, and re-lubrication have been improved due to the optimized pressed steel cage design.

Minimized roller projection enables quick and easy disassembly, repair and reassembly.

Grease dispersion to rolling surfaces is enhanced.

[Allowable Misalignment] ● 0.06 Cr < dynamic equivalent radial load : 0.009 rad (0.5°)
● Dynamic equivalent radial load ≤ 0.06 Cr : 0.035 rad (0.2°)

* If the installed misalignment is greater than recommended, there is a risk of roller/cage protrusion and impact to surrounding components.

RustGuard Corrosion-Resistant Bearings

Rust problems emerge during equipment shut downs when rolls are stationary in the wet environments of the Wire Section and Press Section.
 ULTAGE bearings support stable production in addition to corrosion-resistant performance.

Typical Failure Mechanism

Rust caused by leaving bearings in water-saturated environments

Flaking starts to occur in rusted areas

Downtime caused rust

Flaking

Typical Examples

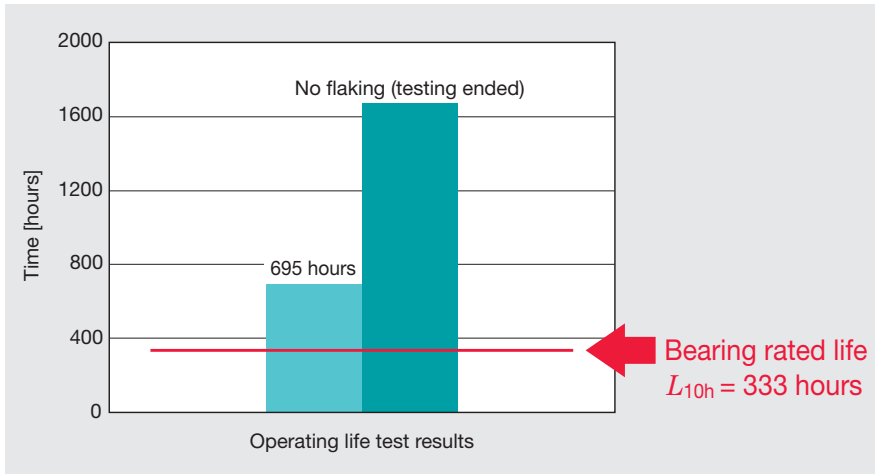

Service	Part Number	Basic Dimensions				Basic Dynamic Load Rating	Basic Static Load Rating
		mm

Wire rolls	MX50-4T-NA759/752D	88.900	161.925	104.775	85.725	270	385

Features

● Impact on operating life

Special phosphate coating treatment does not reduce the operating life.

Unique coating treatment technology eliminates impact on operating life

[Test conditions]
 Bearing : #22318 (Number of rolling elements halved)
 Load : $F_r = 88.3 \text{ kN}$
 Shaft speed : $n = 2500 \text{ min}^{-1}$
 Lubrication : circulating oil VG220, 2 ℓ / min

● Improved corrosion resistance

After a corrosion-resistance performance comparison between untreated rollers (new) and coated rollers (after the operating test), the rust results on the wet surfaces shows that the coated rollers possess corrosion resistance even after the operating test.

● Applicable with various bearing types

Can be applied to all types of bearings, such as spherical roller bearing, tapered roller bearing, etc. Furthermore, it is also suitable for all types of materials, such as bearing steels and case-hardened steels (below : carburized steels).

Long Operating Life EA Bearings

Case-hardened steel has been specially heat treated by composite carburizing and nitriding heat treatment. Therefore, the critical bearing surfaces have been strengthened against surface damage to achieve a dramatic increase in operating life.

Typical Failure Mechanism

Significant fit stress is caused by entry of foreign material and sudden temperature rise.

Inner ring breakage

Smearing, peeling

Poor lubrication

Typical Examples

Service	Part Number	Basic Dimensions			Basic Dynamic Load Rating C_r	Basic Static Load Rating C_{or}
		mm

Features

Operating life improvement for lubricant contaminated by foreign material : **5 times**
 (Compared to NTN's standard carburized steel bearings)

● Improved bearing strength

Material and fitting stress strength has been improved by combining nitrogen during the proper heat treatment conditions.

▶ Operating life for lubricant contaminated by foreign material

Figure 1 shows the results of the operating life comparison test for small tapered roller bearings using lubricant contaminated by foreign material. EA bearings show an operating life over 5 times longer than standard carburized steel bearings.

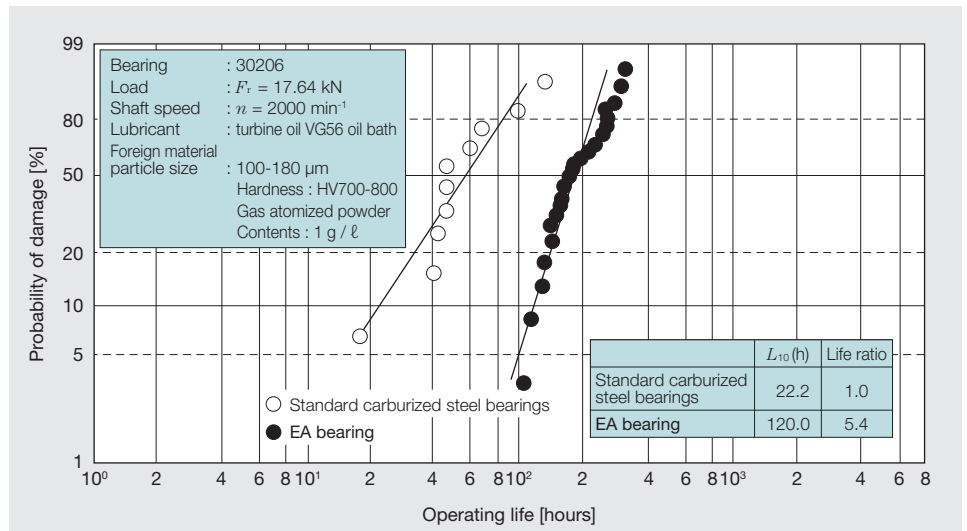

Figure 1. Test results of operating life for lubricant contaminated by foreign material

▶ Fatigue strength

Fatigue cracking causes catastrophic bearing failure. Although this form of damage is anticipated under harsh operating conditions, EA bearings possess a superior fatigue operating life above standard carburized steel bearings as shown in ring rotating fatigue strength testing and rolling fatigue strength testing by applying a large fitting stress, as shown in tables 1 and 2 respectively.

Fatigue cracking life improvement : **1.5 times**
 (Compared to NTN's standard carburized steel bearings)

Table 1. Test results of ring rotating fatigue strength

Bearings	L_{10} (Hours) $\times 10^4$ Cycles	L_{10} Ratio
Standard carburized steel bearings	6 670	1
EA bearing	9 020	1.4

[Test conditions]

Test equipment : NTN ring rotating fatigue strength test equipment
 Load : 9.8 kN
 Load speed : 8,000 cpm

Table 2. Test results of rolling fatigue strength using a large fitting stress

Bearings	L_{10} (Hours) $\times 10^4$ Cycles	L_{10} Ratio
Standard carburized steel bearings	2 030	1
EA bearing	6 240	3.1

[Test conditions]

Test equipment : NTN line contact type rolling operating life test equipment
 Fit stress : 425 MPa applied to rolling surfaces
 Load : 4.9 kN
 Load speed : 6120 cpm

Operating life under high fitting stress is **3 times longer**
 (Compared to NTN's standard carburized steel bearings)

Solid Grease Bearings

Lubricant leakage control is maximized using a solid lubricant composed of lubricating grease and polyethylene.
 Long-term use is made possible by continuous lubrication during equipment operation.

▶ Spot-pack

Deep groove ball bearings are equipped with spot-pack as standard

▶ Full-pack

Spherical roller bearings are full-pack as standard

Typical Failure Mechanism

Features

● Minimal lubricant leakage

Lubricant is fed steadily onto the rotating surfaces by the heat and centrifugal force of the bearings. Minimal lubricant leakage prevents contamination of the surrounding area.

● Resistant to emulsification

Solid Grease is resistant to leaking even when bearings are subjected to large vibration and centrifugal force. The grease is less prone to emulsification even if there is water penetration, exhibiting superior lubrication characteristics compared to general-purpose greases.

Bearing Specifications

● Main ingredients and permissible operating temperature range

Solid Grease (product code)	Resin	Lubricant	Permissible Operating Temperature Range
General-purpose Solid Grease (LP03)	Ultra high molecular weight polyethylene	Li-mineral oil grease	-20~80°C (-4~194°F) max. 60°C (140°F) at regular operation conditions

● Production range

Solid Grease bearing for general use (LP03)

○: Standard type △: Special type ×: Not available

Bearing Designs	Lubricant Packing Method		Bearing Sizes (Bearing Outside Diameter Dimensions)
	Spot-pack	Full-pack	
Deep groove ball bearings	○●	△	Up to 350 mm diameter
Miniature/small dia. ball bearings	○●	×	(Bearing inside diameter : 6 to 9 mm)
Self-aligning ball bearings	×	○●	Up to 250 mm diameter
Spherical roller bearings	×	○●	Up to 250 mm diameter
Bearing units	○●	△	Up to 300 mm diameter
Needle roller bearings	×	○●	●

● Deep groove ball bearings are equipped with spot-pack and ZZ shields as standard. Certain bearing configurations and model numbers listed as standard specification are not available. Contact **NTN** for further information.

● Dimensions of the needle roller bearings differ for each bearing configuration. Contact **NTN** for further information.

Note : Standard bearings are not manufactured from corrosion resistant materials. However, stainless steel bearings are available.

● Minimum required load

In case of full-pack, in order for the rolling elements to rotate without sliding, at least approximately 1% of the basic dynamic load rating is required. Contact **NTN** for more information.

Typical examples of Solid Grease bearings for pulp mill bleach plant

Part Number	Basic Dimensions			Basic Dynamic Load Rating <i>C_r</i>	Basic Static Load Rating <i>C_{0r}</i>
	<i>d</i>	<i>D</i>	<i>B</i>		
22209EAKD1/LP03	45	85	23	121	113
22216EAKD1/LP03	80	140	23	278	287

Remark : Items marked 'K' indicate bearings with a bore taper ratio of 1/12.

Tapered Bore (Type EA)

MEGAOHM™ Insulated Bearings

Electrolytic erosion caused by electric current leakage may occur in bearings used in electrical machinery, such as motors and generators, etc., which shortens the operating life of the bearings. NTN's MEGAOHM™ insulated bearings have been developed to prevent electrolytic erosion. These bearings are available in ceramic or resin types and can be selected to match the application. MEGAOHM™ insulated bearings possess the following excellent features.

Features

- Has insulation properties of 100 MΩ or higher when 500 VDC is applied.
 - Interchangeable with ISO 492, DIN 620, and JIS 1514 standard type bearings.
 - Choose from a broad lineup of insulating materials to match the application requirements for withstanding voltage and impact resistance, etc.
 - Compatible with bearings of inner diameter sizes of 50 to 160 mm.
- * Certain bearing configurations and model numbers among the bearing sizes are not available. Contact NTN for further information.

Typical Failure Mechanism

Construction

▶ Ceramic insulated bearings

▶ Resin insulated bearings

Operating caution : This bearing has an insulating effect and requires appropriate lubrication conditions. Check the conditions and location of use. Contact NTN for technical support.

Triple-Lip Sealed Bearings for Bearing Units

Bearings with excellent dust and water-resistant triple-lip seals achieve a longer operating life in dusty and wet environments.

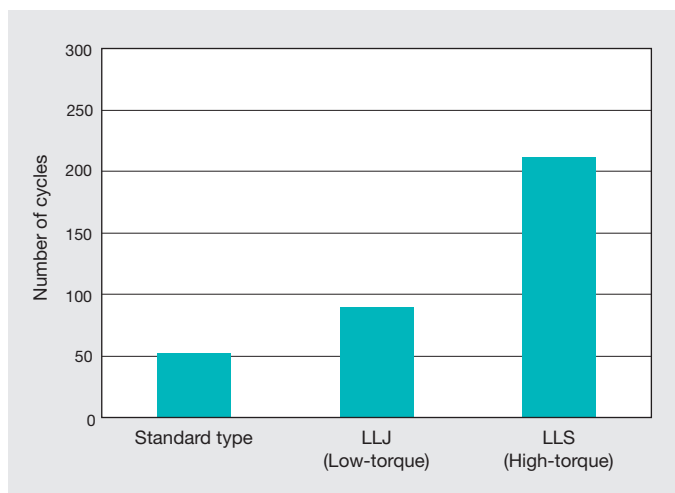

Features

- The excellent dust and water-resistance ability extends the bearing replacement cycle, so maintenance costs are reduced.
- Bearing unit covers, which are typically required, are no longer needed, reducing the size of the bearings.
- Triple-lip seals are suitable for UC configuration bearings, so they are not only usable with the lubricating method but also compatible with the inserts in standard bearing units. Therefore, repair and replacement is easily accommodated.

Construction

▶ Water-resistance performance test results

[Test conditions]

Test bearing	: UC205D1 Standard type, LLJ (low-torque type), LLS (high-torque type)
Shaft speed	: 800 min ⁻¹
Load	: None (belt tension only)
Test mode	: Intermittent operation (6 hours run / 6 hours stop = 1 cycle)
Test equipment	: NTN muddy water test equipment
Muddy water specification	: JIS Z8901 Kanto Loam Class 8
Dust to water mixture ratio	: 1:10 (ratio by weight)
Quantity of muddy water	: 1/4 to 1/3 of outer ring immersed
Testing termination conditions	: Muddy water leakage from bearing, bearing seizure, 0.6 G vibration when operating

Refer to the size charts (p-31)

ULTAGE

ULTAGE Series

Thrust Spherical Roller Bearings

Shaft washer

- Optimal curvature

Cage

- Window-type pressed steel cage

Housing washer

- Optimal curvature

Roller

- Larger rollers
- Maximum number of rollers

Long operating life

- World's highest standard high-load capacity
- Extended maintenance cycle
- Heat resistant to 200°C

Enhanced high-speed performance

- World's highest standard maximum shaft speed
- Simple pressed steel pocket-type cage

Improved handling

- Easy to lubricate design
- Compatible with oil or grease lubrication

Features

● World's highest standard high-load capacity

Long operating life with high-load capacity has been achieved by maximizing the size and number of rollers.

Basic dynamic load rating : **Up to 70% higher** (compared to NTN conventional products)

Operating life : **Up to 6 times longer** (compared to NTN conventional products)

● World's highest standard maximum shaft speed

High shaft speed has been achieved by using a new pressed steel cage.

Up to **20% higher** (compared to NTN conventional products)

NTN conventional product

ULTAGE

● Specifications for pressed steel pocket-type cage

Usage with lubrication by oil and grease has been made possible by using a simplified pressed steel cage-type cage, expanding the usage range.

● Heat resistant up to 200°C

Using a special heat treatment as standard, excellent dimensional stability in high-temperature applications yields a longer operating life.

Allowable Misalignment

▶ 1 ~ 2°

Maximum Shaft Speed

The maximum shaft speeds listed in the bearing size charts are reference values applicable to recommended bearing lubrication and cooling conditions.

The maximum shaft speeds listed in the catalogs are defined as follows.

▶ For oil lubrication

The shaft speed at which the temperature of the housing washer reaches 80°C when 1 liter / 0.25 gallons of VG32 spindle oil is supplied at ambient temperature viscosity, operating at 5% of the basic static load rating C_{0a} .

▶ For grease lubrication

The shaft speed at which the temperature of the housing washer reaches 80°C when the bearing space capacity is 100% packed with lithium grease (consistency : NLG13), running in has been completed, operating at 5% of the basic static load rating C_{0a} .

If the conditions of use (operating load, rotational speed pattern, lubrication condition, etc.) differ for either lubrication method, the temperature rise of the bearing will also differ. Therefore, select a bearing with a sufficient margin of permitted rotational speed, listed in the catalog. Furthermore, contact **NTN** if the bearing application will exceed 80% of the maximum shaft speed listed in the bearing size charts.

Performance Test Results

● Temperature rise test

(1) Vertical axis

[Test conditions]

Bearing model No. : 29418E
(ULTAGE thrust spherical roller bearing)
Axial load : 98 kN (5% C_{0a})
Shaft speed : 1000 to 2200 min⁻¹
Lubrication method : Oil lubrication
(circulating oiling)
Test equipment : Fig. 3

Fig. 3 : Test bearing arrangement

[Test results]

Allowable Radial Load

▶ $F_r / F_a \leq 0.55$

F_r : Radial load

F_a : Axial load

Lubrication Method

Thrust spherical roller bearings have areas in between the bearing rollers and raceway collar surface, etc., where it is more difficult for the lubricant to access. Therefore, ensure the bearings are supplied with sufficient lubrication. When using grease, pack the housing space with grease to ensure the static bearing spaces in the vertical and horizontal axes of the housing, shown in figures 1 and 2 respectively, are properly lubricated.

▶ Vertical axis

Bearing : Static space 100% packed
(Fig. 1-①)
Housing : Space 100%
(Fig. 1-②③)

Fig. 1 : Grease lubrication in the vertical axis

▶ Horizontal axis

Bearing : Static space 100% packed
(Fig. 2-①)
Housing : Space on the side of the bearing washer 100% packed
(Fig. 2-②)

Fig. 2 : Grease lubrication in the horizontal axis

(2) Horizontal axis

[Test conditions]

Bearing model No. : 29418E
(ULTAGE thrust spherical roller bearing)
Axial load : 98 kN (5% C_{0a})
Shaft speed : $n = 1000$ to 2200 min⁻¹
Lubrication method : Oil lubrication
(circulating oiling)
Test equipment : Fig. 4

Fig. 4 : Test bearing arrangement

[Test results]

Refer to the size charts (p-33)

Constant Velocity Joints

Superior performance of constant velocity joints

- No lubrication required** Boot-sealed to enable operation for prolonged periods without lubricating.
- Low vibration/noise efficient rotation** They ensure high quality manufacturing due to their low vibration/noise and efficient rotation (constant velocity rotation) compared to other couplings.
- Ambient environment** They are boot-sealed. Therefore, there is no loss of grease and clean environments can be maintained.
- Easy handling** They are easy to handle because, unlike cross-joints, they require no left-right angle/phase matching or centering during installation.
- Safety** Constant velocity joints are covered by a boot. Therefore, they are safe to handle without risk of trapping fingers in cross-joint yokes.

These joints efficiently transfer rotational torque from an input (electric motor, etc.) to an output (roller, etc.) across a variety of angles and distances.

► BJ

● BJ disc type

- Excellent high-speed rotation performance
- Max. permitted angle : 14-18°

● BJ cup type

- Max. permitted angle : 25°
- Excellent seal performance

► DOJ/BC couplings

● DOJ

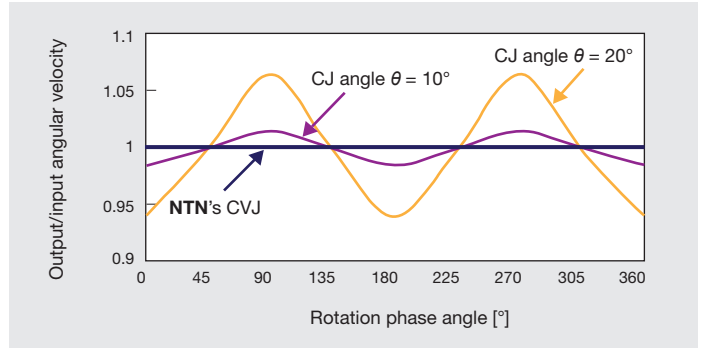

- Extendable inside the joint while under torque load
- Max. permitted angle : 68mm to 200mm size : 20°
225mm to 625mm size : 8° to 10°

● BC coupling

- No need to center/easy to install
- Max. permitted angle : 5°
- Extendable inside main body

Constant velocity joints are completely isokinetic without fluctuation in angular velocity

BC Coupling

BC couplings manufactured by **NTN** can be used in replacement of general couplings.❶

Take a closer look at the easy installation/removal characteristics, degree of angular deflection, and eccentricity that these BC couplings can easily cope with.

Chain Coupling

Gear Coupling

Disc Coupling

Rubber Coupling

By substituting with BC couplings... Replacement

No centering required
Improve work efficiency, reduce maintenance man-hours

No lubrication required
Boot-sealed to enable operation for prolonged periods without lubricating.

Absorb vibration

Comparison of coupling types (50 mm bore diameter comparison) ↓

Coupling Function	Chain Coupling	Gear Coupling	Disc Coupling	Rubber Coupling	NTN BC Couplings

① Items marked 'K' indicate bearings with a bore taper ratio of 1/12. ② Indicates the minimum allowed chamfer dimension γ*.

Dynamic equivalent radial load

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	Y ₁	0.67	Y ₂

Static equivalent radial load

$$P_{0r} = F_r + Y_0 F_a$$

e, *Y*₁, *Y*₂ and *Y*₀ are obtained from the tables below.

Bearing Number

① Items marked 'K' indicate bearings with a bore taper ratio of 1/12, and items marked 'K30' indicate bearings with a bore taper ratio of 1/30. ② Indicates the minimum allowed chamfer dimension r_s.

Dynamic equivalent radial load

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	Y_1	0.67	Y_2

Static equivalent radial load

$$P_{or} = F_r + Y_0 F_a$$

e , Y_1 , Y_2 and Y_0 are obtained from the tables below.

① Items marked 'K' indicate bearings with a bore taper ratio of 1/12, and items marked 'K30' indicate bearings with a bore taper ratio of 1/30. ② Indicates the minimum allowed chamfer dimension r.

Dynamic equivalent radial load

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	Y_1	0.67	Y_2

Static equivalent radial load

$$P_{or} = F_r + Y_0 F_a$$

e , Y_1 , Y_2 and Y_0 are obtained from the tables below.

Part Number		Installation Dimensions						Constant	Axial Load Coefficient			Weight (Ref.) kg	
Cylindrical Bore	Tapered Bore [®]	d_1	$d_{a \text{ min}}$	$D_{a \text{ max}}$	D_1	$r_{as \text{ max}}$	e	Y_1	Y_2	Y_0	Cylindrical Bore	Tapered Bore

① Indicates bearings with a bore taper ratio of 1/12. ② Indicates the minimum allowed chamfer dimension *r**.

Caution when handling bearings

1. Because the internal radial clearance of "ULTAGE Series Sealed Spherical Roller Bearings" with tapered bores cannot be measured with a thickness gauge, please monitor clearances by measuring the axial movement of the inner ring as shown in Table 1.
2. During assembly, if misalignment exceeding the allowable misalignment angle of $\pm 0.5^\circ$ is applied to the bearing, rollers may come in direct contact with seals causing seal deformation. Furthermore, if additional force is applied under these conditions, seals may separate from the bearing entirely. Therefore, caution is advised.
3. Please use Lithium mineral grease. In case other types of grease are to be used, please consult **NTN**.
4. If a shrink fit is to be applied, please do not exceed a bearing temperature of 100°C. However, these bearing cannot be shrink fit via immersion in a hot oil bath.

Bearing Inspection and Maintenance

● Bearing inspection and maintenance

Performing periodic inspections and maintenance of the bearings makes it possible to maintain the original performance of the bearing for a long time, and also detect any early-stage bearing anomalies. Therefore, inspections and maintenance can increase productivity and economic efficiency by preventing bearing failures before they occur.

The inspection items on the right are generally accepted methods for bearing maintenance and care. Depending on the importance of the system or machinery being used, implementing periodic inspection cycles is an important aspect of bearing maintenance and management.

① Inspect the bearings while the equipment is operating

Check the temperature, sound, and vibration of the bearings. Examine the characteristics of the lubricant and determine the cycle for refilling or replacing the lubricant.

② Visually monitor the bearings

Carefully monitor any visible problems that appear when carrying out periodic inspections after the bearings have been in use. If there are visible signs of damage, take measures to prevent recurrence.

*Bearing Damage – Typical Examples & Causes

Refer to the related catalog : Care and Maintenance of Bearings (Cat. No. 3017) for more details.

Installing Tapered Bore Roller Bearings

● Installing tapered bore roller bearings

Install small-sized bearings by using a tapered shaft, withdrawal sleeve, or adapter sleeve. Secure the bearing by tightening the locking nut. Furthermore, tighten the nut with a mallet or impact spanner (See Fig. 1).

Use hydraulic pressure when installing large-size bearings, which require a greater force. Figure 2 (a) shows the method of pushing the bearing onto a tapered shaft using a hydraulic nut. Figures 2 (b) and (c) show the hydraulic nut installation method when using an adapter sleeve or withdrawal sleeve.

With tapered bore bearings, as the inner ring is driven axially onto the tapered shaft, adapter or withdrawal sleeve, the interference will increase and the bearing internal radial clearance will decrease. Interference can be estimated by measuring the decrease in internal radial clearance.

Figure 3 shows the method for measuring the radial internal clearance of a spherical roller bearing by inserting a feeler gauge (thickness gauge) in between the rollers and the outer ring while the rollers are sitting correctly in a non-load position.

The appropriate interference fit is obtained by pushing in the axial direction until the correct clearance reduction is achieved. It is also possible to measure the distance the bearing has been driven axially from the point of initial contact on the taper to achieve the recommended clearance reduction.

A larger interference fit and bearings with a radial internal clearance of C3 or higher are required when heavy loads are applied, when the bearings are running at high speed, and when there is a large temperature difference between the inner and outer rings. Table 1 shows the maximum values for the radial internal clearance reduction and axial displacement amount used during installation. It is necessary to set the residual clearance above the minimum residual clearance value shown in Table 1.

[Ref.] Table 2 shows an example calculation for determining the nut rotation angle when installing a spherical roller bearing using an adapter sleeve.

Note 1 : Applies to solid shaft normal, C3 and C4 clearances

Note 2 : For type 213, refer to the related Ball and Roller Bearings catalog (Cat. No. 2202).

 Note 3 : When clearance C2 and Pr are $> 0.15 Cr$, a separate evaluation is required. Contact NTN for more information.

Table 2. Example calculation for determining the nut rotation angle

Calculation example (approximation)

Conditions

Bearing part number : 22216EAKD1

Inside diameter : 80 mm, outside diameter : 140 mm, width : 33 mm / 1.299"

EA : EA Type, K : bore taper ratio 1/12, D1 : w/lubricant groove/holes

CN clearance : 0.070-0.095 mm

Adapter sleeve : H316X

Nut : M80 × 2 (inside diameter × pitch)

Reference formula

$$\text{Clearance reduction} = \frac{\text{Axial movement amount}}{\text{Taper ratio}} \times \text{Inner ring expansion coefficient}$$

$$\text{Axial movement amount} = \frac{\text{Nut thread pitch} \times \text{nut rotation angle}}{360^\circ}$$

$$\text{Inner ring expansion coefficient} = \frac{\text{Inner ring inside diameter}}{\text{Inner ring average groove diameter}} = \frac{80}{100} = 0.8$$

$$\begin{aligned} \text{Inner ring average groove diameter} &= \frac{2 \times \text{inner ring inside diameter} + \text{outer ring outside diameter}}{3} \\ &= \frac{2 \times 80 + 140}{3} = 100 \text{ mm} \end{aligned}$$

Nut rotation angle calculation

Radial internal clearance reduction (max.) 0.04 mm

$$\text{Clearance after installation} = \text{Initial clearance (measured value)} - \text{clearance reduction} = 0.09 - 0.04 = 0.05 \text{ mm}$$

$$\text{Axial movement amount} = \frac{\text{Clearance reduction} \times \text{taper ratio}}{\text{Inner ring expansion coefficient}} = \frac{0.04 \times 12}{0.8} = 0.6 \text{ mm}$$

$$\text{Nut rotation angle} = \frac{\text{Axial movement amount} \times 360^\circ}{\text{Nut pitch}} = \frac{0.6 \times 360}{2} = 108^\circ$$

Note : For open type bearings, measure the clearances by using a feeler gauge.

Bearing Damage – Typical Examples & Causes

Creep

The inside or outside diameter surface becomes a mirror or cloudy.

[Service]
Press Section

Cause
Insufficient interference fit
Correction
Investigate the interference fit

Inner Ring Breakage

Breaking or cracking occurs.

[Service]
Dryer Section

Cause
Excessive inner ring interference stress, thermal shock, impact, fatigue, poor fitting form
Correction
Investigate the interference fit Use long operating life EA bearings * See page 11

Rust

Rust and corrosion occur on surfaces of raceways and rolling elements.

[Service]
Wire Section, Press Section

Cause
Water penetration, condensation, handling with bare hands
Correction
Improve seal performance Take measures to prevent bearing corrosion during prolonged downtime Utilization of RustGuard Corrosion-Resistant Bearings * See pages 9-10

Flaking (Delamination)

The raceway surface peels away in scale-like flakes.

[Service]

Wire Section, Press Section, Dryer Section

Cause
Excessive load, foreign material penetration
Correction
Change to bearings with a larger load capacity Use of lubricant with a high viscosity

Smearing

Roughening of the raceway surface with minute weld deposits.

[Service]

Calender Stack

Cause
Poor lubricant performance for the rotating motion of the roller elements
Correction
Prevent sliding (reduce the radial internal clearance, consider precompression). Use of lubricant with a high viscosity Use long operating life EA bearings * See pages 11-12

Electrolytic Erosion

Fluting formed by small surface pits across the raceways.

[Service]

Electric Motors

Cause
Raceway surface melting due to electric current conduction and sparking inside the bearing
Correction
Discharge the current via a slip ring, etc. Use MEGAOHM™ Insulated Bearings * See page 15
